1. Position and level units at desired location. Place (1) clamp on the front side of the ganging joint, between the legs. Place the other clamp on the back side of the ganging joint, between the legs (Figure A). **NOTE:** Clamps should have padded jaws.

2. Tighten the front side clamp to allow the ganging bracket to squeeze over each rail of the joint (Figure B). Loosen some pressure from the front clamp. Repeat the process on the back side until the ganging brackets are engaged secure on the joint.

**NOTE:** There are two 6” ganging brackets per joint.

**NOTE:** To remove the ganging bracket place clamps on the front and back sides of the ganging joint and pull down on the bracket.
